Director General
of SKB EP, LLC

The electrotechnical laboratory of Interregionenergotransit, LLP has been using two MIKO-1 devices since 2018.

MIKO-1 is used to measure the resistance of contact connections of switching devices (high-voltage circuit breakers, disconnectors, separators), contact connections of busbars of switchgears.

MIKO-1 meets the stated characteristics, ensures the quality and accuracy of measurements in various conditions. It is easy to use, has a small size and weight. A simple, informative menu makes it easier to operate the measurement process. Independent power supply from the built-in battery allows you to use the device in the field.

With the help of MIKO-1, there were detected malfunctions in terms of exceeding the threshold resistance of contact connections, which made it possible to prevent defects development and electrical equipment damage.

We recommend MIKO-1 to laboratories and companies engaged in the operation of electrical equipment.
