Review about the use of the device

Dear Olga Nikolaevna!

In Taksimovskaya distance of power supply we have been operating MIKO-2.3 micro-milli-kilo-ohmmeter manufactured by SKB EP LLC. This is the second device of this type. The first one, MIKO-1, has been in operation at the distance for about ten years and has proven itself perfectly, as well as the new device. With the help of MIKO-2.3 we check DC resistance of the current-carrying circuit of high-voltage circuit breakers. Large values of this resistance can lead to serious damage of electrical equipment and local heating of current-carrying parts. The advantage of MIKO-2.3 is the design of the test cables with a built-in C-clamp, which provides easy and error-free connection to the measurement object. Light weight and small dimensions make it easy to move the device to the measurement equipment.

I can surely recommend devices manufactured by SKB EP, LLC to other operating companies.
