Review about the use of the devices  
manufactured by SKB EP, LLC

Dear Olga Nikolaevna!

Since 2013, Kaliningrad TPP-2 the branch of Inter RAO - Power Generation JSC has been successfully operating PKV/M7 a high-voltage circuit breaker analyzer. This device is used by the personnel of the electrical department to measure the parameters of SF6 switching devices 110-330 kV.

PKV/M7 device is very simple and easy to use. A simple and clear menu does not require special training or skills to work with it. The device itself is quite compact, easy to carry and transport to remote objects. PKV/M7 is suitable for carrying out measurements for all types of circuit breakers (SF6, oil, vacuum) and does not require additional remote units, which makes it very convenient to operate. The fact that one employee is able to complete all the work significantly reduces the labor costs for preparing and performing measurements. The device allows you to automatically measure and calculate the parameters of the tested equipment, and the use of the internal memory of the device simplifies and speeds up the process of filling out measurement reports and protocols. Also important is the presence of the extended range of supply voltages of the device that significantly reduces the time spent looking for a power source, especially at remote sites.

During the entire operation of PKV/M7, no problems or malfunctions were detected with the device. Without a doubt, I would recommend using this device to other companies.

Chief of electrical department  
of Kaliningrad TPP-2

A.V. Ponomarev
