Review of the instrument operation

Almet'yevsk city

Dear Olga Nikolaevna!

Our company purchased MIKO-10 instrument in 2021.

We will use this instrument to determine the resistance of the lead wires to direct current. The accuracy of measuring this parameter is very important in the production of electric motors, and it is regulated with Technical conditions.

The instrument has been in operation for five months. The first impressions, the first results of the instrument operation are very good. The instrument is autonomous, mobile, does not depend on 220 V network. The battery charge lasts for a long time. Connecting wires has sufficient length, 10 A Kelvin clamp test cable terminals are quite durable.

Generally, we are satisfied with the purchase.

Chief of the testing lab

R.A. Gabdrafikov
